understanding mathematical modeling is fundamental in chemical engineering this book reviews introduces and develops the mathematical models that are most frequently encountered in sophisticated chemical engineering domains the volume provides a collection of models illustrating the power and richness of the mathematical sciences in supplying insight into the operation of important real world systems it fills a gap within modeling texts focusing on applications across a broad range of disciplines the first part of the book

discusses the general components of the modeling process and highlights the potential of modeling in the production of nanofibers these chapters discuss the general components of the modeling process and the evolutionary nature of successful model building in the electrospinning process electrospinning is the most versatile technique for the preparation of continuous nanofibers obtained from numerous materials this section of book summarizes the state of the art in electrospinning as well as updates on theoretical aspects and applications part 2 of the book presents a selection of special topics on issues in applied chemistry and chemical engineering including nanocomposite coating processes by electrocodeposition method entropic factors conformational interactions and the application of artificial neural network and meta heuristic algorithms this volume covers a wide range of topics in mathematical modeling computational science and applied mathematics it presents a wealth of new results in the development of modeling theories and methods advancing diverse areas of applications and promoting interdisciplinary interactions between mathematicians scientists engineers and representatives from other disciplines

revised and updated design and optimization in organic synthesis presents strategies to explore experimental conditions and methodologies for systematic studies of entire reaction systems substrates reagent s catalyst s and solvents chemical phenomena are not usually the result of a single factor and this book describes how statistically designed methods can be used to analyse and evaluate synthetic procedures the methodology is based on multivariate statistical techniques the accompanying cd contains data tables and programmes this book is essential reading for anyone working in process design and development in fine chemicals or the pharmaceutical industry and is suitable for those with no experience in the field contains recalculated models and redrawn figures as well as new chapters on for example the design of combinatorial libraries presents strategies to explore experimental conditions and methodologies enables the analysis and prediction of the best synthetic procedures

the book focuses on 2 aspects of human performance theory reaction processes and attention these aspects are often ignored by treatments of cognitive psychology but are central to understanding an individual s performance

the research process in this book begins with identification of the research question and proceeds through each step including planning data collection actual collection and analysis of the data and writing the report this text proceeds through multiple methodologies including experimental and non experimental quantitative and qualitative at every step the emphasis is on planning and executing the study key features o simulations and feedback that may be used in class sessions for both individual and small group participation o pedagogy to help students plan and conduct a research project in an actual classroom o examples that demonstrate and explain what constitutes good and poor research questions o case studies and real life examples related to education o a student site that provides students with the opportunity to interact with contemporary articles this book provides an introduction to research that emphasizes the fundamental concepts of planning and design it is designed to be a core text for the very first course on research methods
